Correction: Cloning and expression of complementary cDNAs for multiple members of the human cytochrome P450IC subfamily
Biochamistry 32, 1390-1390 (1993)
Biochamistry 32, 1390-1390 (1993)
Biochamistry 32, 1390-1390 (1993)
Resequencing demonstrated that it is not a separate gene under Accession Number M61888
Resequencing demonstrated that it is not a separate pere, but is a splice variant or a composite cDNA. The 5' portion corresponds to a partial 2018 clone, and the 3' portion corresponds to a partial 2018 clone.

The 5' end from 10 931 corresponds to a partial allelic variant of 2018 beginning a base fall of 2018 concinuing through base pair 1039 canding for 11e 129 instead of Met 129 and 8 to A change at 387 coding for 11e 129 instead of Met 129 and 8 to A change at 187 coding for 11e 129 instead of Met 129 and 6 to A change at 187 coding for 10131 instead of Met 129 and 6 to A change at 187 coding for 10131 stated of Met 129 and 6 to A change at 187 coding for 10131 stated of Met 129 and 6 to A change at 187 coding for 10135 instead of Met 129 and 6 to A change at 187 coding for 10135 instead of Met 129 and 8 to A change at 187 coding for 10135 instead of Met 129 and 8 to A change at 187 coding for 10135 instead of Met 129 and 8 to A change at 187 coding for 10135 corresponds to a partial 2019 clone through base pair 1612.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HUMSYP450A 2395 bp mRNA PRI 26-JUL-1993

Example 2; Column 35-38; 63pp: English.	This sequence encodes a cytochrome P450 2019 polypeptide isolated	from human clone 11a. This polypeptide is used in a method to screen for a drug that is metabolised by a cytochrome P450 having S-mephenytoin		large family of haemoprotein enzymes capable of metabolising xenobiotics such as drugs carcinogens and environmental molitaries as well as	endobiotics such as steroids, fatty acids and prostaglandins.	Sequence 1746 BP; 477 A; 418 C; 365 G; 486 T; 0 other;	Match 99.6%: Score 17	No. 0; Lindels 0;	atcettttataateettataetetetetetetetetetet		tetanaanaanatetanaanaanaanaanateenteente	tetggagacagagetetgggagagagaaaaeteeetetggeeeeteeteteeatga 12	-		74		30		· ·				-		ccaaggettcacctqtgatccactttcatcctgggctgtgctcacatgtactc54	481 ccaaggettcaccetqtqatccacttcatcctqqctqqctqqctccctccatqqtct 540	9		aaaaattgaatgaaaacatcaqqattgtaagcacccctgqatccaqatatgcaatat	· · ·		ttccactatcattgattatttcccgggaacccataacaaattacttaaaaaccttgctt 72	aaaqtqatattttqqaqaaaqtaaaqqaacaccaaqaatcqatqqacatcaa	11111111111111111111111111111111111111	781 acceteggaetttottgattgetteetgatesaaatgagaaggaaaggaaaaccaac 840

The present invention relates to a method for determining gene structure when the genomic sequence is unknown. The method involves structure when the genomic sequence is unknown. The method involves sequencing the gene across exon-intron boundaries using evenly spaced primers or tiled primers. The tiled primers competies motivate across the form of the Example 2; Fig 3; 81pp; English.

```
This sequence encodes the cytochrome P450 2C19 and was isolated from a human liver CNRA library. 2C19 proteins exhibit stereospecific S-compehenytoin 4-hydroxylase activity, with a typical activity of at least I manol mephenytoin per man of 2C19 per min. 2C19 is thought to be the principal human determinant of this activity in the 2C19 gene contains polymorphisms at nucleotides 636 and 681 of the genomic coling sequence. These can be detected using specific PKE primers which ether amplify the wild type or the mutant altele but not both. These mutations cause the polypeptide to lack substantial shockbarytoin 4-hydroxylase activity, however the phenotype in most individuals which lack S-mephenytoin 4-hydroxylase activity. So casults from a complete or substantial absence of 2C19 polypeptide.

2C19 can be used to identify drugs metabolised by S-mephenytoin C - hydroxylase activity which should not be administered to individuals with a deficiency in S-mephenytoin 4' hydroxylase activity.
                                                                                                                                                                                                                                                                                                                                                            New isolated cytochrome P450 2C subfamily member - used for identifying drugs metabolised by 5-mephonyoin 4'-hydroxylase activity and to develop other screening assays
                                                                                                                                                                                                                                                                     De Morais SMF, Goldstein JA, Romkes-Sparks M;

This sequence represents the wild type human liver derived cytochrome P450 ZC19 agene. Modified versions of the encoded protein are the proteins of the human in a cid with Ala and a deletion of amino acid residues 3-20 of the main or acid residues 3-20 of the vill type. Modified cytochrome P490 ZC19 is useful for, uninterrupted whusto.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     18] amaictalgyccrtqigitcartcigiaittiggrciggancgoalggiggiggigcigcig 240

cytochrome P450 protein. The fusion protein can oxidise hydrocarbons or any compound having a carbon-hydrogen boad. The fusion protein can be used for hydroxylating a compound to be oxidised. It can also be used be the bloremediation of an environmental pollutant. Since the fusion protein is soluble. It can be subject to structural elucidation by X-ray exptailography for designing functional proteins. It can be readily expressed in soil bacteria to facilitate bloremediation. The present sequence encodes mammalian cytochrome PATO protein CYP209 from the
                                                                                                                                                                                    invention describes a fusion proteins comprising a portion at cytochrome P450 protein and also a portion of a mammalian

cc and a polyadenylation signal 21 bases from the poly.A tail. Clone 5b cc has an unusually long 3'-noncoding region containing three possible cc polyadenylation signals with no poly.A tail. The differences in the 3' cc ratiants, or possibly separate genes. These clones are designated as a liellor variants of 2C18 because they differ by only one base in the cc coding region. They are most similar to 2C9 (82% amino acid homology). XX So sequence 1852 BP; 514 A: 424 C; 380 G; 534 T; 0 other; Ouery Match 87.9%; Score 1534.6; DB 17; Length 1852; Bast Local Similarity 92.9%; Pred.                                                                                                                                                                                                                                                                                                                       This sequence encodes a human cytochrome P450 2C9 polypeptide isolated from clone 65. This polypeptide is used in a method to screen for a drug that is method; listed by a cytochrome P450 having S-mehenytoin 4. ** ***Mycroxylase activity. The protein can also be used to identify a mutagento, carcinogenic or cytochrome compound. Cytochrome P450 are a large family of hamoprotein enzymes capable of metabolishing xenoblotics such as druggens and environmental pollutants as veil as endoblotics such as steroids; fatty acids and prostaglandins.

```

results in one amino acid difference at position 359, lle to Leu. The clones 29c and 6b differ by one nucleotide in the coding region, position 1154. Which results in a single amino acid change. This to Met at position 185. Clone 25c has a very long, 189 bb. 5'-noncoding region and a polyaderylation signal 21 bases iron the poly. A tail. Clone 6b has an unusually long 3'-noncoding region containing three possible polyaderylation signals with no poly. A tail. The differences in the inon-coding regions could represent alterate splicing, allellic variants or possibly separate genes. These clones are designated as allellic variants of 2C18 because thay differ by only one base in the coding region could may be account the second of the coding regions could represent alternate splicing, allellic coding regions could represent alternate splicing, allellic coding regions could represent alternate splicing, allellic

This sequence encodes a cytochrome P450 2C9 polypeptide isolated from than clone 25. This polypeptide is used in a method to screen for a drug that is metabolised by a cytochrome P450 having S-mephenytoin C-hydroxylase activity. The protein can also be used to identify a mutagenic, carcinogenic or cytochrome palso be used to identify a mutagenic, carcinogenic or cytochaic compound. Cytochrome P450 are a lurge family of haemoprotein enzymes capable of metabolising xenobiotics such as drugs carcinogens and environmental pollutants as well as endobiotics such as steroids, fatty acids and prostaglandins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Screening for drugs metabolised by cytochrome P450 \cdot for identifying mutagenic, carcinogenic, or cytotoxic compounds

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             this sequence encodes a human cytochrome P450 2C polypeptide. This by veptide is used in a method too screen for a drug that is methodised by a cytochrome P450 having S-mephenytoin 4' hydroxylase activity. The protein can also be used to identify a mutegenic, carcinogenic or cytochrome P450 are a large family of haemoprotein earymes capable of metabolising xenoblotics such as drugs carcinogens and earlingmantal pollutants as well as endoblotics such as steroids, faity acids and prostaglandins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Screening for drugs metabolised by cytochrome P450 - for identifying mutagenic, carcinogenic, or cytotoxic compounds

The invention relates to a method for producing pigent Using cells containing cytochrome P450 sequences II involves the use of genetic material encoding a cytochrome P450.

The modifications comprise a substitution of the second amino acid with Ala and a deletion of amino acid with Ala and a deletion of amino acid very employed. Woulfied cytochrome of amino acid residues 3.20 of the wild type. Modified cytochrome pt90 3C19 is useful for, uninterrupted metabolism of therapeutics, e.g. omeprazole, diazepam and imipramine in humans.

Libraries using Random Activation of Gene Expression,
wature Biotechhology, in press. Note that even though the cell type indicated is Hillogo, since a random activation
method was used, these sequence tags are not necessarily
expressed in Hillogo under normal circumstances.

Libraries using Random Activation of Gene Expression', Nature Bulcechnology, in press. Note that even though the Cell type indicated is H1080, since a random activation method was used, these sequence tags are not necessarily expressed in H1080 under normal circumstances.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Harrington, J.J.  TITLE OF INVENTION: CLONING AND EXPRESSION OF COMPLEMENTARY Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed. and is derived by analysis of the total score distribution.

SUMMARIES

Cloning and expression of complementary DNAs for multiple members of the human cytochrome P450IIC subfamily blochemistry 30, 3247-3255 (1991) 5118740 2 (bases 1 to 743) sapiens yota: Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi: lia; Eutheria; Primates; Catarrhini; Hominidae; Homo.                                                       NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ALS83836.11 GI:14455940

NOIE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/doss/Genbank_draft_data.html).

NOIE: This is a 'working draft' sequence. It currently consists of 21 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
